

# Quick Start Guide

1. With a tape measure, locate an area about 1/3 the height of your tank and 45° to 90° from the water softener or any metal to place the top of the sensor unit. This is where the Salt Sensor will be mounted in Step 4.
2. Clean the area using a general purpose cleaner or mild soap and water. Using the supplied wipe, clean off an area a little larger than the size of the Salt Sensor and let dry.
3. Peel off the backing from the strips on the adhesive.
4. With the middle of the Salt Sensor even with your mark, battery side down, keep the unit straight as you press the Salt Sensor onto the salt tank. Press each side firmly for 15 seconds.
5. Pull the tab on the battery. You will See an RGB LED.
6. Fill the salt tank a minimum of 5 inches above the top of the Salt Sensor.
7. Press and hold the reset button for two seconds until it beeps, then release.
